

```
```python
print("Hello, world!")
```
```

This simple code is a classic first program in many programming languages.

Here's what it does:

```
* **`print()`**:
```

 This is a function that displays text on the screen.  

```
* **`"Hello, world!"`**:
```

 This is the text that you want to display.

When you run this code, it will output the following to the console:

```
```
Hello, world!
```
```

This is a basic example of how to write and execute a program, a great starting point for your coding journey!

Let me know if you'd like to explore more basic examples in Python or other programming languages. I'm here to help you get started!
